

Web Movements for Clubs with Dealing Machines and Wireless Scoring

Tim Hill <thill75@wesleyan.edu>, 2009 November 13

introduction

In most club games, each pair plays 24 to 28 deals. Many clubs use Mitchell movements for sections with anywhere from four to 17 tables. These movements are simple for players and directors, but often they are unbalanced because pairs don't play all of the same deals. If two to four "extra" deals are in play, the imbalance is relatively minor, but for some table counts six to 15 extra deals are in play and 20% or more of the comparisons are "apples and oranges"—i.e., one pair's matchpoint or IMP score on one deal is, in effect, compared with another pair's matchpoint or IMP score on a different deal.

All pairs can play all or almost all of the same deals by using Web movements for table counts in which Mitchell movements require too many extra deals in play. Web movements used to be used very rarely, because they required either lots of board sharing or manually twinned boards. Now dealing machines make routinely predealing twinned boards practical (dealing about 26 boards takes about eight minutes), and wireless scoring devices make managing and scoring a Web movement simpler and more reliable, so a well-prepared director can use Web movements for regular club games.

■ terminology

To minimize ambiguity, I'll stick to these terms:

A "deal" is an arrangement of 52 cards.

A "board" holds one copy of a deal.

A "case of boards" is one copy of all the deals in play.

A "deal group" is the set of deals played in one round at one table.

A "board group" is one copy of a deal group.

t is the number of tables in a section, counting a phantom pair but not counting a rover pair or a party table.

r is the desired number of rounds to be played.

d is the number of deal groups in play. ($r \leq d \leq t$. In a Mitchell movement, $d = t$. In a Web movement, $d < t$.)

$d - r$ is the number of "extra" deal groups in play. (In a Mitchell movement, $d - r = t - r$, which may be large. In a Web movement, d is usually chosen to make $d - r$ be 0 or 1.)

As explained below, in a Web movement:

 a "subsection" is a part of a section with its own case of boards,

n is the number of subsections of size d ($n \geq 0$), and

s is the size of each of the last two subsections ($0 \leq s < d$).

■ Web movements

Web movements were invented in the 1970s by ACBL tournament director John "Spider" Harris to solve a problem in major multisession single-winner events. They were little used in other situations because they required manually twinned boards (or lots of board sharing) and were more complicated to manage and score than Mitchell movements. Now clubs with dealing machines and wireless scoring can use them routinely to minimize extra deals in play and to avoid three-board sitouts.

Web movements are like Mitchell movements in many respects:

- NS pairs are stationary.
- EW pairs move up a table after each round.
- If d is even, EW pairs skip a table after round $\frac{d}{2}$. (Note that in a Mitchell movement $d = t$, so you can think of an even t requiring a skip after round $\frac{t}{2}$. In a Web movement, $d < t$. A skip is needed if d is even, regardless of whether t is even, and the skip must be after round $\frac{d}{2}$.)
- For the most part, boards move down a table after each round.

Web movements differ from Mitchell movements in that $d < t$. (The director usually chooses $d = r$ or $d = r + 1$, so the number of “extra” deal groups in play, $d - r$, is 0 or 1.) This implies that in any given round at least one deal group must be played at at least two tables. While this can be accomplished by sharing or manually twinning boards, it is most easily accomplished with multiple machine-dealt cases of boards.

■ Web movements for even t

The basic building block of a Web movement is two equal-size subsections of s tables, each with its own case of boards. Board the first of these two subsections in ascending order, like a Mitchell. There will be $d - s$ board groups left over. Put the left-over board groups on a bye stand from which they feed (in ascending order) into the last table of the subsection. Have the first table of the subsection pass boards to the bye stand.

The “magic” that guarantees that an EW pair will always play different boards as it passes through these two subsections is the way the second subsection is boarded. Board the second subsection in *descending* order, with board group $s - 1$ on the first table, board group $s - 2$ on the second table, ... board group 1 on the next-to-last table, and board group d on the last table. Put the left-over board groups on a bye stand from which they feed *in descending order* into the last table of the subsection. Have the first table of the subsection pass boards to the bye stand.

Here’s an example with $t = 6$, $d = r = 5$, $s = 3$, a [blue case of boards](#), and a [red case of boards](#):

	round 1		round 2		round 3		round 4		round 5	
table	EW	bdgrp	EW	bdgrp	EW	bdgrp	EW	bdgrp	EW	bdgrp
1	1	1	6	2	5	3	4	4	3	5
2	2	2	1	3	6	4	5	5	4	1
3	3	3	2	4	1	5	6	1	5	2
bye		4		5		1		2		3
bye		5		1		2		3		4
4	4	2	3	1	2	5	1	4	6	3
5	5	1	4	5	3	4	2	3	1	2
6	6	5	5	4	4	3	3	2	2	1
bye		4		3		2		1		5
bye		3		2		1		5		4

This example, with $t = 6$, $d = r = 4$, and $s = 3$, requires a skip after round $\frac{d}{2} = 2$:

	round 1		round 2			round 3		round 4	
table	EW	bdgrp	EW	bdgrp		EW	bdgrp	EW	bdgrp
1	1	1	6	2	skip	4	3	3	4
2	2	2	1	3	skip	5	4	4	1
3	3	3	2	4	skip	6	1	5	2
bye		4		1			2		3
4	4	2	3	1	skip	1	4	6	3
5	5	1	4	4	skip	2	3	1	2
6	6	4	5	3	skip	3	2	2	1
bye		3		2			1		4

■ Web movements for odd t

Obviously, two equal-size subsections can only handle an even t . However, the two subsections of size s can be preceded by a subsection of size d , which is boarded in ascending order like a Mitchell. For an odd t , choose an odd d ($r \leq d \leq t$).

Here's an example with $t = 11$, $d = r = 5$, and $s = 3$:

	round 1		round 2		round 3		round 4		round 5	
table	EW	bdgrp	EW	bdgrp	EW	bdgrp	EW	bdgrp	EW	bdgrp
1	1	1	11	2	10	3	9	4	8	5
2	2	2	1	3	11	4	10	5	9	1
3	3	3	2	4	1	5	11	1	10	2
4	4	4	3	5	2	1	1	2	11	3
5	5	5	4	1	3	2	2	3	1	4
6	6	1	5	2	4	3	3	4	2	5
7	7	2	6	3	5	4	4	5	3	1
8	8	3	7	4	6	5	5	1	4	2
bye		4		5		1		2		3
bye		5		1		2		3		4
9	9	2	8	1	7	5	6	4	5	3
10	10	1	9	5	8	4	7	3	6	2
11	11	5	10	4	9	3	8	2	7	1
bye		4		3		2		1		5
bye		3		2		1		5		4

Note that allowing boards to flow between the first subsection—tables 1-5—and the second subsection—tables 6-8 with a 2-board-group bye stand—may simplify the board movement:

	round 1		round 2		round 3		round 4		round 5	
table	EW	bdgrp	EW	bdgrp	EW	bdgrp	EW	bdgrp	EW	bdgrp
1	1	1	11	2	10	3	9	4	8	5
2	2	2	1	3	11	4	10	5	9	1
3	3	3	2	4	1	5	11	1	10	2
4	4	4	3	5	2	1	1	2	11	3
5	5	5	4	1	3	2	2	3	1	4
6	6	1	5	2	4	3	3	4	2	5
7	7	2	6	3	5	4	4	5	3	1
8	8	3	7	4	6	5	5	1	4	2
bye		4		5		1		2		3
bye		5		1		2		3		4
9	9	2	8	1	7	5	6	4	5	3
10	10	1	9	5	8	4	7	3	6	2
11	11	5	10	4	9	3	8	2	7	1
bye		4		3		2		1		5
bye		3		2		1		5		4

■ generalized Web movements

Most generally, a Web movement has $t = n d + 2 s$ tables, comprising n subsections of size d and two subsections of size s , where $n \geq 0$, $d \geq r$, and $0 \leq s < d$.

When using pre-dealt boards, the director normally chooses $d = r$, so that no extra deal groups are in play—everybody plays all the deals. Note, however, that if t is odd, then n and d must both be odd. This implies that if t and r are both even, then $d \neq r$. In this case, the director normally chooses to have one extra deal group in play, $d = r + 1$. (An alternative is to start with a movement for $t - 1$ tables with $d = r$ and add a rover and a party table, but having one extra deal group in play is probably a lesser evil than the added complexity of a rover and a party table.)

Note that some other movements are special cases of generalized Web movements:

Mitchell: $n = 1, s = 0$

Continuous Mitchell: $n > 1, s = 0$

Bowman, Ewing: $n = 1, s = 1$

1½-table appendix Mitchell: $n = 1, s = 1$, NS pair t is a phantom

■ Web movements for ACBLscore

The only web movements that are built into ACBLscore are for even t and odd d . This package includes ACBLscore .MOVement files for all of the following Web movements:

```

(A Web movement can handle an arbitrarily large section. It seems unlikely that a single section larger than $t = 25, d = 13$ would ever be desirable, but I've generated .MOVement files up to $t = 39, d = 13$, which is the largest Web that works with three cases of boards, just in case.)

■ half tables, late pairs, rovers, and party tables

Web movements, like Mitchell movements, can handle half tables with either a phantom pair or a rover pair.

If a late pair arrives after you have started boarding a full-table Mitchell movement, you can simply add a table and put another board group in play, or you can make the late pair a rover, which avoids putting an extra board group in play. On the other hand, if a late pair arrives after you have started boarding a full-table Web movement, adding a table switches between an even and an odd number of tables, which have quite different boarding patterns, so you'll have to reboard about half the tables. Making the late pair a rover avoids reboarding.

If you already have a rover and a(nother) pair arrives late, you can add a "party table." The party table is so named because pairs move to it only when "invited"—the normal movement of EW pairs and boards bypasses the party table.

The two extra pairs play the first round at the party table (time permitting). After the first round, one of these pairs remains stationary at the party table and the other is a rover. The pairs bumped by the rover don't sit out—they're invited to the party table.

After the first round, the party table always plays the same deal group as the rover. In the first round, the party table plays a/the deal group that it won't play in later rounds. (The order in which the party table plays deals and opponents is not obvious—you just have to look it up.)

The party table is numbered $t + 1$. (To minimize the chance of an EW pair trying to move from table t to the party table, put a note on table t telling EW pairs to move to table 1 and don't put the party table near table t .)

For every $WEBttd$ movement in this package, there is a NS-rover-plus-party-table variant, named $WEBttdNSR$, and an EW-rover-plus-party-table variant, named $WEBttdEWR$. These movements are for $t + 1$ tables (e.g., $WEB1812NSR$ is for a total of 19 tables—18 “regular” tables plus the party table). With a half table (i.e., a rover but no party table), make the stationary pair at the party table a phantom.

■ board cases

Even-table Web movements with $t \leq 2d$ require two cases of boards. Odd-table Web movements with $t \leq 3d$ generally require three cases of boards, but when $s = 1$ the two single-table subsections can share a case with little difficulty (they play the same deal group in just one round—round $\frac{d+1}{2}$).

A party table can borrow or share boards (in Web movements, copies of the boards the party table needs are often on one of the bye stands), but it's much simpler if a party table has its own case of boards. (A non-playing director with a dealing machine on site can deal for a party table during the game.)

A club that wants to be prepared for the possibility of a movement that needs three cases of boards doesn't have to deal three cases for every game (unless it's a special game that requires a particular set of deals)—they can keep a set of three cases ready to be used when needed.

■ acknowledgments

Tim Francis-Wright, the master of funky movements, led the way.

Pete Matthews' `bridgemats` program <http://web.mit.edu/mitdlbc/www/bridgemats/> creates placemats from ACBLscore movement files and dumps movement files. These placemats are a big help when running a Web, Rover, or Party-table movement without a wireless scoring system. Pete's code also helped me figure out how to generate movement files.

David Metcalf learned about odd-table-count Web movements from his fellow ACBL tournament director, Doug Grove.

Despite their initial skepticism, Bob Simpson and David Metcalf have allowed me to run Web movements in their clubs.

■ percentage of “apples and oranges” comparisons

This table gives the fraction of comparisons in some common Mitchell movements that are “apples and oranges”—i.e., one pair's matchpoint or IMP score on one deal is, in effect, compared with another pair's matchpoint or IMP score on a different deal.

39-table 13-round Web movement + EW rover & party table

total tables including party table: 40

13 deal groups in play

Table 40 is a party table. EW pair 40 is a rover.

NS pair 40 is stationary.

Pairs bumped by the rover play at the party table.

For an EW-rover movement without a party table,

make NS pair 40 a phantom.

two sections

For many table counts you may prefer to run two sections rather than

For example, for two ten-table sections with eight deal groups in play, the boarding pattern (using board group numbers) is:

A: 1, 2, 3, 4, 5; 4, 3, 2, 1, 8

B: 6, 7, 8, 1, 2; 1, 8, 7, 6, 5

Use two cases of boards for the ten \uparrow tables: A1, A2, A3, A4, A5, B1, B2, B3; B4, B5; with board groups 3-8 on a bye stand.

Use the third case of boards for eight \downarrow tables: A6, A7, A8, A9, A10, B8, B9, B10 (or A6, A7, A8, B6, B7, B8, B9, B10).

The remaining two \downarrow tables, B6 and B7 (or A9 and A10), use boards borrowed from the bye stand in most rounds, but must share in some rounds.

A superior alternative for two ten-table sections with eight deal groups in play uses an $8\uparrow 1\uparrow 1\downarrow$ boarding pattern for one section rather than the usual $5\uparrow 5\downarrow$. This permits a smooth board movement with no borrowing or sharing. The boarding pattern is:

A: 1, 2, 3, 4, 5, 6, 7, 8; 1; 8

B: 2, 3, 4, 5, 6; 5, 4, 3, 2, 1

Use two cases of boards for the 14 \uparrow tables: A1-9, B1-5; with board groups 7 and 8 on a bye stand between B5 and A1.

Use the third case of boards for the six \downarrow tables: B6-10, A10; with board groups 7 and 6 on a bye stand between A10 and B6.

The alternative boarding pattern for an even table count can also be useful if you have to switch between an even and an odd table count after you've started boarding. For example, it's much easier to switch between $8\uparrow 1\uparrow 1\downarrow$ and $9\uparrow 1\uparrow 1\downarrow$ than it is to switch between $5\uparrow 5\downarrow$ and $9\uparrow 1\uparrow 1\downarrow$.

For lack of a better term, we'll name the alternative movements for even t and even d "bis." The basic movements minimize n and maximize s (for example, the regular movement for $t = 10, d = r = 8$ has $n = 0$ and $s = 5$). The bis movements maximize n and minimize s (for example, the bis movement for $t = 10, d = r = 8$ has $n = 1$ and $s = 1$). Here's the full set of bis movements for even t where $8 \leq t \leq 38$ and $d = 8$ or 12 , including the rover and/or party table variants:
